

## How Can We Help?

People are already helping by releasing them into the wild and making enclosures. We can put radio collars on them to keep track of them and protect them.

## Leopard

---

## Interesting Facts

A Leopard can run one hundred kilometers per hour. It can also climb trees and swim.

Leopards are most active between sunset and sunrise.

## Description

Leopards can weigh more than one hundred pounds. They are about two feet tall and seven feet long.

A female leopard's fur is softer than a male's fur. They can vary in color depending on their habitat and location.

A Leopard eats buffalo, zebra, wildebeest, gemsbok, har-tebeest, impala, and smaller types of antelope.

It lives in Africa, south of the Sahara and northeast of Asia.

## Why are they endangered?

The Leopard is endangered because people are destroying their food source when they build. Their habitat also gets ruined while people build farms.

People also illegally trade their skin and use it for clothing. People would also kill them illegally for their body parts.

Also people kill the leopards when they attack people's live stock. Which decreases their population.

Some people also go trophy hunting but in Tanzania people are only allowed to hunt males.
